

Code Explanation

Code Explanation

File: ``glue_pyspark/src/main/__init__.py``

Purpose

This file marks the ``main`` directory as a Python package and provides package metadata.

Step-by-Step Breakdown

****Step 1: Package Initialization****

```
"""AWS Glue PySpark ETL Pipeline - Main Package"""
```

- The docstring documents the package purpose- Identifies this as the main package for an AWS Glue PySpark ETL pipeline

****Step 2: Version Declaration****

```
__version__ = "1.0.0"
```

- Defines the package version using semantic versioning (MAJOR.MINOR.PATCH)- The ``__version__`` attribute is a Python convention for exposing version information- Can be accessed programmatically:
``from main import __version__``

Functionality

- ****Makes `main` a Python package****: Allows imports like ``from main.module import function``-
****Provides version tracking****: Enables version checking and compatibility management- ****Minimal overhead****: Contains no executable logic, only metadata

Usage Context

This initialization file would typically be part of a larger project structure where:- Other modules exist in the ``main`` package directory- The version can be referenced for logging, compatibility checks, or deployment tracking- The package can be imported as a cohesive unit
