

Code Explanation

Code Explanation: `glue\_pyspark/src/main/\_\_init\_\_.py`

Purpose

This file serves as the Python package initializer for the main source code module of an AWS Glue PySpark ETL job focused on customer order processing.

Step-by-Step Breakdown

Step 1: Package Initialization

The `\_\_init\_\_.py` file marks the `main` directory as a Python package, allowing other modules to import code from this location using standard Python import statements (e.g., `from main import module\_name`).

Step 2: Module Documentation

```
"""AWS Glue PySpark ETL Job - Customer Order ProcessingMain package
initialization"""
```

- Provides a docstring describing the package's purpose- Identifies this as an AWS Glue PySpark ETL job- Specifies the business domain: Customer Order Processing

Step 3: Version Metadata

```
__version__ = "1.0.0"
```

- Defines the package version using semantic versioning (MAJOR.MINOR.PATCH)- Version 1.0.0 indicates this is the first stable release- Can be accessed programmatically via `main.\_\_version\_\_`

Step 4: Author Metadata

```
__author__ = "AWS Glue ETL"
```

- Identifies the package author/owner- Can be accessed programmatically via `main.\_\_author\_\_`

Functional Impact

- **No runtime logic**: This file contains only metadata and documentation- **Package discovery**: Enables Python to recognize the directory as an importable package- **Metadata access**: Allows other modules to query version and author information- **Documentation**: Provides context for developers working with the codebase

Common Usage Pattern

Other modules can access this metadata:

```
import mainprint(main.__version__) # Outputs: 1.0.0print(main.__author__) #
Outputs: AWS Glue ETL
```
