

Code Explanation

Code Explanation: `\_\_init\_\_.py`

This file serves as the **package initialization module** for the `glue\_pyspark/src/main` Python package.---

Step-by-Step Breakdown

1. **Module Docstring** - Describes the package purpose: an AWS Glue PySpark job for customer order analytics - Indicates use of **SCD Type 2** (Slowly Changing Dimension Type 2) for tracking historical changes - Notes **Apache Hudi** as the underlying storage framework2. **Package Metadata Variables** - `\_\_version\_\_ = "1.0.0"`: Defines the current release version - `\_\_author\_\_ = "Data Engineering Team"`: Identifies the maintaining team - `\_\_description\_\_`: Provides a one-line summary of functionality---

Purpose

- Makes `glue\_pyspark/src/main` a valid Python package (importable)- Exposes metadata for introspection (e.g., `import main; print(main.\_\_version\_\_)`)- Documents the package's scope and technical approach at the entry point---

Key Observations

- **No executable logic**: This file only declares metadata- **SCD Type 2 + Hudi**: Signals the job maintains full history of dimension changes using Hudi's MERGE capabilities- **AWS Glue context**: Designed to run in AWS Glue's PySpark environment
