

Code Explanation

Code Explanation: `glue\_pyspark/src/main/\_\_init\_\_.py`

Purpose

This file serves as the **package initialization file** for the `main` module in a Python AWS Glue PySpark ETL project.

Step-by-Step Breakdown

Step 1: Package Marker

The presence of `\_\_init\_\_.py` marks the `src/main/` directory as a Python package, allowing other modules to import code from this location.

Step 2: Module Documentation

```
"""AWS Glue PySpark ETL Job - Customer Order ProcessingMain package
initialization"""
```

- Provides a **docstring** describing the package purpose- Indicates this is an AWS Glue job for customer order processing- Documents that this is the main package initialization

Step 3: Version Metadata

```
__version__ = "1.0.0"
```

- Defines the **package version** using semantic versioning (MAJOR.MINOR.PATCH)- Can be accessed programmatically via `import main; print(main.\_\_version\_\_)`- Useful for tracking releases and compatibility

Step 4: Author Metadata

```
__author__ = "Data Engineering Team"
```

- Identifies the **responsible team** for this codebase- Provides contact/ownership information for maintenance

Functional Impact

- **No executable logic** - this file only provides metadata- Enables the directory to be treated as an importable Python package- Establishes version control and ownership information- Other modules can now use `from main import ...` statements

Common Usage Pattern

When other files need to check the version:

```
from main import __version__ print(f"Running ETL job version {__version__}")
```
