

Code Explanation

Code Explanation: `glue\_pyspark/src/test/\_\_init\_\_.py`

Purpose

This file initializes the **test package** for an AWS Glue PySpark ETL job. It serves as the entry point for organizing and documenting test modules.---

Step-by-Step Breakdown

1. **Module Docstring**

```
"""Test package for AWS Glue PySpark ETL Job..."""
```

- Describes the package's purpose: testing a Customer Order Analytics ETL job.- Notes the job uses **SCD Type 2** (Slowly Changing Dimension) processing with **Apache Hudi** format.- Lists available test modules (`test\_job`).---

2. **Version Metadata**

```
__version__ = "1.0.0" __author__ = "Data Engineering Team"
```

- `\_\_version\_\_`: Tracks the test package version (1.0.0).- `\_\_author\_\_`: Identifies the maintaining team.---

3. **Public API Declaration**

```
__all__ = [ "test_job", ]
```

- Defines what gets imported when using `from test import \*`.- Explicitly exposes the `test\_job` module for external use.- Helps control namespace pollution and clarifies intended public interfaces.---

Summary

This `\_\_init\_\_.py` file:- Marks the directory as a Python package.- Documents the test suite's scope (ETL job with SCD Type 2 + Hudi).- Declares metadata (version, author).- Specifies which test modules are part of the public API.**No executable logic** is present—it's purely organizational and declarative.
